Q.1) Compare the e-waste data of India with 5 other nations given in paper and reflect comment.

Q.2) Give 5 methods which can be implemented in India from paper.

Q.1) According to the paper, India recorded the highest annual growth rate of e-waste generation among the countries studied between 2015-2019. While China remained the world's largest producer of e-waste and the US ranked second, India's e-waste increased much more rapidly due to rapid urbanization, economic growth, and rising use of electronic devices. In contrast, Germany showed almost no growth in e-waste generation, while the UK and France experienced only slow increases because of their well-developed collection and recycling systems. Unlike these developed countries, India has limited formal recycling infrastructure and relies heavily on the informal sector for e-waste management. This comparison shows that although India's e-waste generation is growing rapidly, it needs stronger recycling policies, better collection systems, and improved public awareness to manage e-waste sustainably.

Q.2) 1) Strengthen Extended Producer Responsibility (EPR)- Make manufacturers responsible for collecting and recycling e-waste.
2) Develop formal recycling facilities- Increase authorized collection and recycling centres.
3) Promote public awareness- Educate People on

proper e-waste disposal and recycling
4) Support reuse and refurbishment - Encourage repair and reuse of electronic products to reduce waste.
5) Enforce stricter e-waste policies - Ensure effective implementation of laws and better monitoring of e-waste management.
